

Heat Exchanger Frame Options

Painted Frame Work

All Heatex exchangers are available with powder painted frame work for corrosion protection.

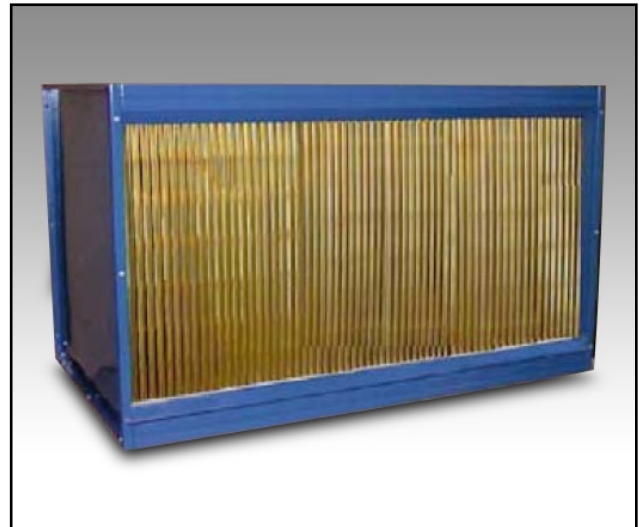

Painted frame work includes sealed joints in the frame work, which we recommend for wet and humid applications.

Epoxy Coated Plates

All Heatex aluminium exchangers are available with epoxy coated aluminium plates for improved corrosion resistance in demanding situations, such as swimming pools and coastal environments.

Closed Plate Cutting Edges

For the best possible protection against corrosion, add this option. A lacquer is run along the joints of the plates, covering the cutting edges found on epoxy coated plates. This action may also improve the already high tightness of the exchanger and limit leakage to a minimum. Do note, the exchanger will never reach a 100% water tightness.

The standard channel tightness is achieved with a hot melt sealant mechanical folding. If necessary, this can be improved by extra sealing with lacquer.

Extended Frame Work

Heatex exchangers are available with or without bypass and with or without damper.

Heatex can also supply custom made extended frame works, with possible integration of bypass, damper, drain pan, and drain connections for condense water.

Extended framework promotes quick assembly of air handling units.

The extended frame works are made in aluzinc sheeting, and may on request be powder painted.

All extended frame works are custom made and offered according to your special requirements.

Owing to continued product development Heatex America reserves the right to introduce alterations both in design and prices without prior notice.
